Analyse et Traitement de l'Information

TP1: Linear Algebra

---

1 The importance of the mathematical concept behind a code

1. Download, open and run several times the MATLAB® file "TP1/some_script.m". Explain the function "deviate_vector" in geometrical terms and then explain the results of this code with clear mathematical concepts (you have to speak about projections and scalar product).

   THEN, IT IS VERY IMPORTANT TO UNDERSTAND THE MATHEMATICAL CONCEPTS BEHIND A PROGRAM!!

2. Let's consider $A = (a_{i,j})$ a 4×10 matrix. How would you clearly write the following part of script using some mathematical notations:

$$
\begin{aligned}
&r = 0 \\
&for\ i = 1 : 4 \\
&\quad for\ j = 1 : i \\
&\qquad r\ =\ r\ +\ i \times (a_{i,j})\hat{}\, j \\
&\quad end \\
&end
\end{aligned}
$$

2 Computing Eigenvalues, Eigenvectors, and Determinants

1. Find the determinant, eigenvectors, and eigenvalues of the matrix

$$
A = \begin{bmatrix} 3 & 5 & -5 \\ -5 & -7 & 5 \\ -5 & -5 & 3 \end{bmatrix}.
$$

   Let us consider V_1, V_2 and V_3 the 3 column vectors of the matrix

$$P = \begin{bmatrix} -1 & 1 & -1 \\ 1 & 0 & 1 \\ 1 & 1 & 0 \end{bmatrix}.$$

Show that V_1, V_2 and V_3 are eigenvectors of the matrix A, and give their corresponding eigenvalues. Comment on the fact that these vectors differ from the previously found eigenvectors of A. Compute the matrix $P.diag(3, -2, -2) - A.P$ and explain the result

2. The *covariance matrix* for n samples $\boldsymbol{x}_1, \ldots, \boldsymbol{x}_n$, each represented by a $d \times 1$ column vector, is given by

$$C = \frac{1}{n-1} \sum_{i=1}^{n} (\boldsymbol{x}_i - \boldsymbol{\mu})(\boldsymbol{x}_i - \boldsymbol{\mu})^T,$$

where C is a $d \times d$ matrix and $\boldsymbol{\mu} = \sum_{i=1}^{n} \boldsymbol{x}_i / n$ is the *sample mean*. Prove that C is always positive semidefinite. (Note: A symmetric matrix C of size $d \times d$ is *positive semidefinite* if $v^T C v \geq 0$ for every $d \times 1$ vector v.)

3. In this portion of the exercise, we will calculate the eigenvalues of the covariance matrices of six data sets listed as follows:

filename	n	d	description
`tp1_artificialdata[1-3].mat`	1024	100	Artificial data generated from various auto-regression (AR-1) models
`tp1_artificialdata4.mat`	1024	100	Random Gaussian data
`tp1_freyfaces.mat`	1965	560	Facial images of a man named Brendan
`tp1_digit2.mat`	5958	784	Hand-written images of "2"

To access each data set, go to ``TP1/data'' and download `tp1_`$\star$`.mat`. Each file contains a $n \times d$ data matrix with rows representing n different samples in $\Re^d$. For example, `tp1_artificialdata1.mat` contains a data matrix of size 1024×100 (1024 samples, 100 features). Once each dataset has been imported into MATLAB®, complete the following tasks:

(a) Compute the covariance matrix of each dataset;

(b) Compute the eigenvalues for each covariance matrix;

(c) Compute the determinant of each covariance matrix;

(d) Compute the product of the eigenvalues for each covariance matrix;

(e) Display the eigenspectrum for each covariance matrix in a 2D plot, where the x-axis shows the rank of the eigenvalues, ranging from 1 (the largest eigenvalue) to 100 (the 100-th largest eigenvalue), and the y-axis shows the corresponding eigenvalue.

Describe the relationship between the product of the eigenvalues and the determinant of each covariance matrix. In addition, describe the observations you make regarding the plot of the spectrum of eigenvalues of each covariance matrix.

3 Computing Projection Onto a Line

There are given a line $\alpha : 3x - 2y = -6$ and a point A with the coordinates $(5, 4)$.

1. Find a distance from the point A to the line α.
2. Explain your code using a sketch and some mathematics (there should be a scalar product somewhere).

Submission

Please archive your report and codes in "Prénom Nom.zip" (replace "Prénom" and "Nom" with your real name), and upload to "`Upload TPs > Upload TP1`" on `https://moodle.unige.ch` before Monday, September 30 2019, 23:59 PM. Note, the assessment is mainly based on your report, which should include your answers to all questions and the experimental results. IMPORTANCE IS GIVEN ON THE MATHEMATICAL EXPLANATIONS OF YOUR WORKS AND YOUR CODES SHOULD BE COMMENTED.

Supplements

1. Define and explain the mean and the variance on some examples.
2. Define and explain what is a vector space, a projection and a scalar product.
3. Define and explain what is a vector space, a basis and a change of basis transformation matrix.
4. Present the eigen-value decomposition and the singular-value decomposition.
